

Tips on How to Measure Polythene!

TO CALCULATE THE SHEET WIDTH:

Look at the options below to decide the width of sheet that is required:

Option 1: Trenching into the ground:

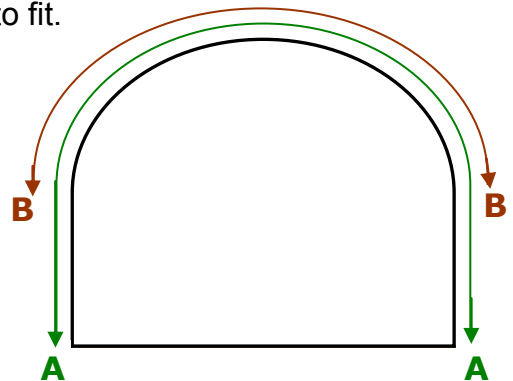

A to A i.e. ground to ground over the hoop, plus approx **2m** extra (to line trenches).

Option 2: Attaching to Timber Base or Ground Rail:

A to A i.e. ground to ground over the hoop, plus **1m** extra to fit.

Option 3: Attaching to Alum Base or Ground Rail:

A to A i.e. ground to ground over the hoop,
plus **1m** extra to fit.

Option 4: Attaching to Side Rail:

B to B i.e. side rail to side rail over the hoop, plus **1m** extra fit.

TO CALCULATE THE SHEET LENGTH:

Length of Polythene required =

(Length of Structure) + (Height from ridge to ground x 2) + (2 metres)
